<u>AMENDMENTS TO THE SPECIFICATION:</u>

At page 10, please replace paragraph [0035] as indicated below.

[0035] The data element selected in steps 401 and 501 can be e.g. ProvURL, which is a URI and specifies the path of the WAP provisioning server. The WAP specifications specify that this ProvURL identifier must not be shortened, and accordingly the identifier to be set in the management tree could become long, unless the ProvURL identifier [[were]]is not hashed in steps 404 and 504. The ProvURL identifier may be a parameter of the Bootstrap characteristic:

...

```
<characteristic type="Bootstrap">
        <parm = "ProvURL" value="http:/www.operator.com/Trusted_WAP-
Provisioning_Server/"/>
</characteristic>
```

...
